

ALEXIS PAILLET

Research engineer in the space industry

Alexis Paillet joined the French space agency sixteen years ago to work on the development, assembly and testing of space instruments for Mars exploration (ChemCam, a Franco-American instrument on board the Curiosity rover, and SEIS -Seismic Experiment for Interior Structure-, a seismometer and the main scientific instrument on board the InSight Mars lander). For the past 2 years, Alexis has been project manager of the FR spaceship, which aims to prepare human and robotic space exploration by validating French technologies on Earth, deploying them on test bases in order to start exploring the Moon and exporting the model to Mars.
